Rehabilitation of the severely resorbed maxilla using an implant-anchored prosthesis presents a complex challenge to the oral and maxillofacial surgeon. Particularly in the maxilla, loss of alveolar bone height and buccolabial bone width, often combined with a reduction in bone density, severely compromises its retention capacity. This book reports the authors' 15-year experiences with autogenous onlay bone grafting and simultaneous endosseous implant placement in the reconstruction of the edentulous atrophic maxilla. With an overall survival rate of 95% after 5 years and 93% after 10 years, this approach offers a highly predictable treatment option for patients who previously could not benefit from implant treatment.

ISBN: 0-86715-398-9

184 pp; 515 illustrations; 222 color illustrations

Table of Contents

Preface
 Chapter 1 The Challenge of the Severely Resorbed Maxilla
 Chapter 2 Protocol for Long-Term Study of Autogenous Onlay Bone Grafting and Simultaneous Endosseous Fixture Placement
 Chapter 3 Patient Presentations from Routine Cases
 Chapter 4 Patient Presentations from Compromised Cases
 Chapter 5 Patient Presentations from Unusual Cases
 Chapter 6 Results of the Study
 Chapter 7 The Future of Onlay Grafting
 Appendix Patients with Discontinuous Maxillary Defects
 References
 Index
